

Sustainability statement

crevin

Crevin is committed to maintaining a sustainable and environmental-friendly business. The following key principles form part of our corporate identity and work routine.

Philosophy

1. We design for durability; this means that we intend to get the most out of raw materials and resources by giving our fabrics the longest life possible.

2. Through our design and marketing activities we aim at fostering wide understanding of a sustainable and environmentally responsible business.

3. Crevin is committed to manufacturing high quality products in compliance with legal requirements and the least possible impact on the environment, as documented in our ISO 9001 and ISO 14001 certifications.

Quality and durability

4. Crevin fabrics have been designed and manufactured in accordance with current European regulations using the highest quality materials, in order to ensure their durability and sustainability.

5. Crevin is a vertical company that manufactures 100% of its product range on site and executes an exhaustive and constant quality control in all production stages.

6. Crevin fabrics are created in accordance with the highest European quality standards for upholstery and tested in independent accredited laboratories.

Design and manufacturing

7. The textile heritage and knowhow of our local community form the basis of Crevin's design and manufacturing.

8. At Crevin we promote the use of sustainable raw materials such as recycled polyester, polypropylene and regenerated cotton for the manufacture of our fabrics, as well as a yarn designed from our own textile waste, and thereby reducing the consumption of virgin raw materials and the resources needed to produce them.

9. Suppliers, materials and industrial processes are employed for our fabrics only when they comply with the environmental and sustainable product criteria established by Crevin.

Health and safety

10. Crevin guarantee that all their fabrics are designed and manufactured without putting people's health at risk.

11. In 2020 we obtained the Oeko-Tex ST100 certification for all our fabrics, the most important the most important product safety certification in textiles.

12. Crevin carefully select their suppliers that at any time should be able to provide safety information on the chemical substances used for the raw materials they supply, in accordance with the European REACH Regulation (Registration, Evaluation and Authorization of Chemical Products- EC 1907/2006).

13. Crevin is committed to safeguarding the well-being of their employees by providing safe and healthy working conditions.

Natural resources

14. Crevin's manufacturing process is carried out with an optimal sequence of production stages, in which inefficiencies and operations that negatively impact the environment are eliminated, accounting for less energy consumption, less waste and minimization of atmospheric emissions.

Sustainability

15. Crevin select their suppliers taking into account the quality of raw materials as well as proximity, as such reducing the impact of carbon emissions during transport.

16. For their packaging of rolls of fabric, in 2022 the film used already contains 75% recycled plastic.

17. Crevin's dyeing process is carried out with the most efficient use of dye stuff and effective drying, saving in water and gas use.

18. Waste water from Crevin's finishing plant is treated before discharge. In April 2022, the new ultrafiltration and recovery plant for waste water from the dyeing and finishing process will be industrially commissioned. During 2022 we have saved 43% of network water.

19. Crevin's staff is environmentally conscious and actively participates in recycling projects and activities to save water and energy.

20. In 2022 we have already begun to communicate to our customers, for the first time, the carbon and water footprints of our products, based on the results of the Life Cycle Analysis study carried out together with the Universitat Politècnica de Catalunya according to internationally recognized standards. This information is found individually on each product sheet.

Waste

21. Crevin constantly evaluate waste and excess materials in order to identify new recycling ways

22. The percentage of revaluable waste over the total generated waste was 83% in 2022

23. Crevin recycle 100% of the leftovers of their weaving plant into new yarn. Using a circular process, the rest materials are collected and sent to a local yarn spinner. The regenerated yarn is sent back to Crevin and applied to new fabric. During the recycling process no chemicals are used to sanitize or recolour the fibre.

24. Crevin's staff actively participates in programs for the segregation of waste materials such as plastic, cardboard, paper, toners and pallets that are managed through authorized waste managers, for periodic collection and subsequent reprocessing and recovery. Throughout 2022, 66 tons of textile waste have been collected and converted into recycled yarn, giving textile waste a second life.

Upon request, Crevin will provide more factual information to customers on the above mentioned activities and routines.
